

PRESENTATION

Briquetting of biomasses

ATNA
Industrial
Solutions
GmbH

The logo for ATNA, featuring the letters 'ATNA' in a bold, dark blue, sans-serif font. The letters are set against a white circular background. A vertical line runs through the center of the circle, passing through the 'N' and extending above and below the circle's boundary.

ATNA

OUR MISSION

Revolutionising briquetting

There must be a better way! This idea drove us forward at the beginning. Previous briquetting presses were often inefficient and thus caused high costs. We had to eliminate those weak points.

Mechanical engineers, process engineers, and electrical engineers in our founding team worked together to develop an entirely new concept of briquetting technology. Today we know: We can do much better!

SCOPE OF APPLICATION

Recycling renewable resources

ATNA presses are ideal for briquetting biomass. They can process (waste) wood, bagasse, rice straw, or fermentation products.

These bio-briquettes can be used as raw materials (gasification, pyrolysis) or energy sources to fuel industrial ovens or domestic heating systems.

SCOPE OF APPLICATION

Gasification

Thanks to the excellent briquette quality, ATNA presses are ideal for preparing raw materials for use in almost all gasification methods.

For example, fine materials, such as woodchips or straw can be fed into inexpensive and efficient fixed-bed gasifiers.

Application options:

- Generating product gases such as H₂
- Fuelling combined heat and power plants (CHP)

SCOPE OF APPLICATION

Pyrolysis

Thanks to the innovative pressing process, ATNA presses are suitable for preparing input materials for pyrolysis or efficiently forming briquettes from the resulting biochar.

Application options:

- Production of biochar briquettes (barbecues, stoves)
- Generation of product gases
- Production of chunky adsorbents

SCOPE OF APPLICATION

Biofuel

Since burning briquettes made of dried biomass, such as (waste) wood, bagasse, or fermentation residues, is carbon-neutral, they are the environmentally friendly alternative to lignite briquettes.

Thanks to their high quality, briquettes can be burned on inexpensive reciprocating or travelling grates or used in domestic fireplaces.

Application options:

- Biomass briquettes for industrial combustion (as loose bulk material)
- Biomass briquettes for domestic heating purposes (as packets)

YOUR ADVANTAGES

We deliver added value

Companies that briquette biomass save on storage and transport costs and process their residual and waste materials more efficiently. Moreover, thanks to the wide range of potential applications, they can enter new business fields in the areas of pyrolysis, gasification, or combustion.

OUR SOLUTION

GreenLine briquetting presses

The multi-stage pressing process of ATNA GreenLine presses allows maximum flow rates while ensuring the highest briquette quality. To this end, we deliver innovative solutions tailored to your company.

Multi-stage pressing method

Thanks to our novel turret punch press and multi-stage pressing method, which consists of precompacting, pre-pressing, pressing, and ejection, we are able to achieve high flow rates at low energy consumption.

TECHNICAL SPECIFICATIONS

GreenLine

Our GreenLine briquette presses fit perfectly into your production environment. Thanks to the compact external dimensions, straightforward installation without the need for additional foundation, and the simple connection, you will be able to use the press and reduce your costs right away. The technical specifications listed here refer to a standard GreenLine briquette press without additional features.

YOUR OPTIONS

Extension options

- Upstream chip shredder
- Online dashboard with mobile access
- Automatic wear measurement
- Automatic density measurement
- Adjustable hydraulic system
- Extraction system for dusty materials
- Remote maintenance to ensure timely service
- Preparation for outdoor installation

YOUR WISHES

Customised solutions

Every company is unique. For this reason, we work with our customers to develop individual solutions tailored to their requirements.

We provide connection to customer's workflows, such as complete extraction systems for in-house material transport to the briquetting press.
